

JICHUAN 2001 OIL TREATMENT

SUPER OIL TREATMENT

PRODUCT DESCRIPTION:

JICHUAN 2001 is a clear, viscous liquid additive used to increase the motor oil viscosity index (V.I.). The thickener is a high molecular weight polymer which is mixed with a paraffin oil used as carrier. It mixes well with all mineral oils.

TYPICAL USES:

JICHUAN 2001 is designed to be added to the oil in the leaks and crankcase (cars, trucks, buses, etc.) At operating temperatures add 10% JICHUAN 2001. For older worn out engines, e.g., burning and leaking Oil, add up to 15% JICHUAN 2001.

NOTE: It is not recommended if the engine has broken rather than worn out parts. JICHUAN2001 will find limited use in new engines except in extending oil life and protecting engine parts from wear and tear.

FEATURES:

JICHUAN 2001's main function is to reduce oil consumption and to increase engine compression. The high molecular weight polymer used is very stable even under extreme conditions as determined using the CRC L-38 test (Coordinating Research Council). The oil is protected against breaking down from shear and pumping action. This polymer increases the oil V.I. and the oil viscosity: thereby improving ring sealing action. Engine noise is also greatly reduced. Protects the oil life and minimizes corrosion and oxidation on the engine internal parts including rings, cams and lifters. Because of V.I. improvement, some fuel savings may also be noticeable.

TYPICAL INSPECTIONS

GRAVITY,°API	32.7
GRAVITYSPECIFIC	0.8610
VISCOSITY	
cSt@100°C.	730
COLOR,ASTMD-1500	2.5
APPEARANCE	BRIGHT&CLEAR

VALUES SHOWN HERE ARE TYPICAL AND MAY VARY
